# Outline

- Spline Representations
- Cubic-Spline Interpolation

# Spline Representations

- Last day we said how to represent a spline using its parametric cubic  $(x(u), y(u))$  where  $u$  is in  $[0,1]$ , the endpoint values  $(x(0), y(0))$ ,  $(x(1), y(1))$  and derivatives at the endpoints  $(x'(0), y'(0))$  and  $(x'(1), y'(1))$ . Here  $x(u)$  looks like:  $a_x * u^3 + b_x * u^2 + c_x * u + d_x$ . and  $y(u)$  is similar.
- Today we'll look at different ways to represent this same equations

# Other Representations

- Note could write  $x(u)$  as:  
 $[u^3 \ u^2 \ u \ 1][a_x \ b_x \ c_x \ d_x]^t = \mathbf{U} \cdot \mathbf{C}$  (the little  $t$  is for transpose)
- One can also write  $\mathbf{C}$  as  $\mathbf{M}_{\text{spline}} \cdot \mathbf{M}_{\text{geom}}$  where  $\mathbf{M}_{\text{spline}}$  is a the boundary values on the spline and  $\mathbf{M}_{\text{geom}}$  contains a 4x4 matrix based on the coordinates of the control points.
- Thus,  $x(u)$  is sometimes written as  $\mathbf{U} \cdot \mathbf{M}_{\text{spline}} \cdot \mathbf{M}_{\text{geom}}$  which is called the *basis matrix*.
- Finally, sometimes see splines represented in terms of coordinates of control points as  $x(u) = \sum_{k=0}^3 g_k \cdot \text{BF}_k\{u\}$  where  $\text{BF}_k$  are called blending functions.

# Spline Surfaces

- The splines discussed so far were 2D. Can also specify surfaces.
- To do this need to specify sets of orthogonal spline curves using a mesh of control points.
- Might have an equation like:

$$P(u,v) := \sum_{i,j} p_{i,j} BF_i(u) BF_j(v)$$

# Trimming Spline Surfaces

- Sometimes in CAD applications it is useful to be able to trim out sections from a spline surface.
- Some graphics packages have facilities to generate **trimming curves** to support this

# Cubic-Spline Interpolation Methods

- Rather than using general splines of arbitrary degree, cubic splines are often used to design objects because they are reasonably flexible and can be computed and stored efficiently.
- Consider the curve

- One wants to be able to approximate this curve with cubic splines.

# More on Cubic Spline Interpolation

- Between each pair of control points  $p_k, p_{k+1}$  we will try to find a best approximating cubic spline.  $(x(u), y(u), z(u))$  where  $x(u), y(u), z(u)$  are cubics in  $u$ .
- To do this we need to set enough boundary conditions at the endpoints of a segment so this spline is uniquely determined.
- Next few slides discuss different ways to do this

# Natural Cubic Splines

- In these kind of spline, if have  $n+1$  control points then we specify  $n$  cubic splines.
- We specify the values of the spline, its first and second derivative, at each of its endpoints.
- We require adjacent splines to have matching values at the endpoints.
- To complete the description usual set the first and second derivative of  $p_0$  and  $p_n$  to be 0.

# Hermite Interpolation

- Natural splines are hard to locally update
- For Hermite splines we specify the value of the tangent at each control point rather than say that this value must be equal among adjacent curves.
- For example, if want to specify curve  $P$  between two points  $p_k, p_{k+1}$ , would use equations:

$$P(0) = p_k$$

$$P(1) = p_{k+1}$$

$$P'(0) = Dp_k \text{ Here } Dp_k \text{ is some fixed value like 4.}$$

$$P'(1) = Dp_{k+1}$$

# More on Hermite Interpolation

Now  $\mathbf{P}(u) = \mathbf{a}u^3 + \mathbf{b}u^2 + \mathbf{c}u + \mathbf{d}$  for  $0 \leq u \leq 1$

- That is  $\mathbf{P}(u) = [u^3 \ u^2 \ u \ 1][\mathbf{a} \ \mathbf{b} \ \mathbf{c} \ \mathbf{d}]^t$
- Taking the derivative we have  $\mathbf{P}'(u) := [3u^2 \ 2u \ 1 \ 0][\mathbf{a} \ \mathbf{b} \ \mathbf{c} \ \mathbf{d}]^t$
- Substituting values 0 and 1 for  $u$  in the above gives us the matrix equation:

$$\begin{bmatrix} \mathbf{p}_k \\ \mathbf{p}_{k+1} \\ \mathbf{p}_k \\ \mathbf{p}_{k+1} \end{bmatrix} = \begin{bmatrix} 0 & 0 & 0 & 1 \\ 1 & 1 & 1 & 1 \\ 0 & 0 & 1 & 0 \\ 3 & 2 & 1 & 0 \end{bmatrix} \begin{bmatrix} \mathbf{a} \\ \mathbf{b} \\ \mathbf{c} \\ \mathbf{d} \end{bmatrix}$$

Call the inverse matrix  $\mathbf{M}_H$ . Can solve now for  $\mathbf{a} \ \mathbf{b} \ \mathbf{c} \ \mathbf{d}$  by taking  $\mathbf{M}_H$ .

# Yet More on Hermite Interpolation

- So  $\mathbf{M}_H$  is:

$$\begin{bmatrix} 2 & -2 & 1 & 1 \\ -3 & 3 & -2 & -1 \\ 0 & 0 & 1 & 0 \\ 1 & 0 & 0 & 0 \end{bmatrix}$$

- $\mathbf{P}(u) = [u^3 \ u^2 \ u \ 1] \mathbf{M}_H [\mathbf{p}_k \ \mathbf{p}_{k+1} \ \mathbf{Dp}_k \ \mathbf{Dp}_{k+1}]^t$
- From which we can calculate the blending functions:

$$\mathbf{P}(u) = \mathbf{p}_k(2u^3 - 3u^2 + 1) + \mathbf{p}_{k+1}(-2u^3 + 3u^2) + \mathbf{Dp}_k(u^3 - 2u^2 + u) + \mathbf{Dp}_{k+1}(u^3 - u^2)$$

$$\mathbf{P}(u) = \mathbf{p}_k H_0(u) + \mathbf{p}_{k+1} H_1(u) + \mathbf{Dp}_k H_2(u) + \mathbf{Dp}_{k+1} H_3(u)$$
