• Human visual based approach like JPEG is not an optimized approach for Deep Neural Networks.
• New compression framework for deep neural net applications - DeepN-JPEG
• Expriments on ImageNet dataset shows compression ratios of approx. 3.5 x higher compression rate over JPEG
• DeepN-JPEG preserves important features crucial for DNN classification.

• Neural nets treat all frequency components equally while human visual system (HVS) focuses more on low frequency information.

• Key step of DeepN-JPEG is to redesign HVS inspired quantization table to be DNN favorable.

• Quantization table redesign is a intractable optimization problem because of complexity of parameter search.
