

# **CH. 4 THE COMPONENTS OF THE SYSTEM UNIT**

**By Valerie Williams**

# THE SYSTEM UNIT

- System unit is case that has electronic components of the computer used to process data.
- A motherboard or also know as system board, is the main circuit board of the system.

# THE SYSTEM UNIT

- A chip is a small piece of semi-conducting material, usually silicon, on which integrated circuits are etched.
- Integrated circuit contains many microscopic pathways capable of carrying electrical current.
- Most chips are not much bigger than one half inch square.

# PROCESSOR

- The central processing unit (CPU) interprets and carries out basic commands that run a computer.
- Multi-core processor is one chip with two or more separate processor cores.
- Dual core processor is a chip that has two separate processor cores.

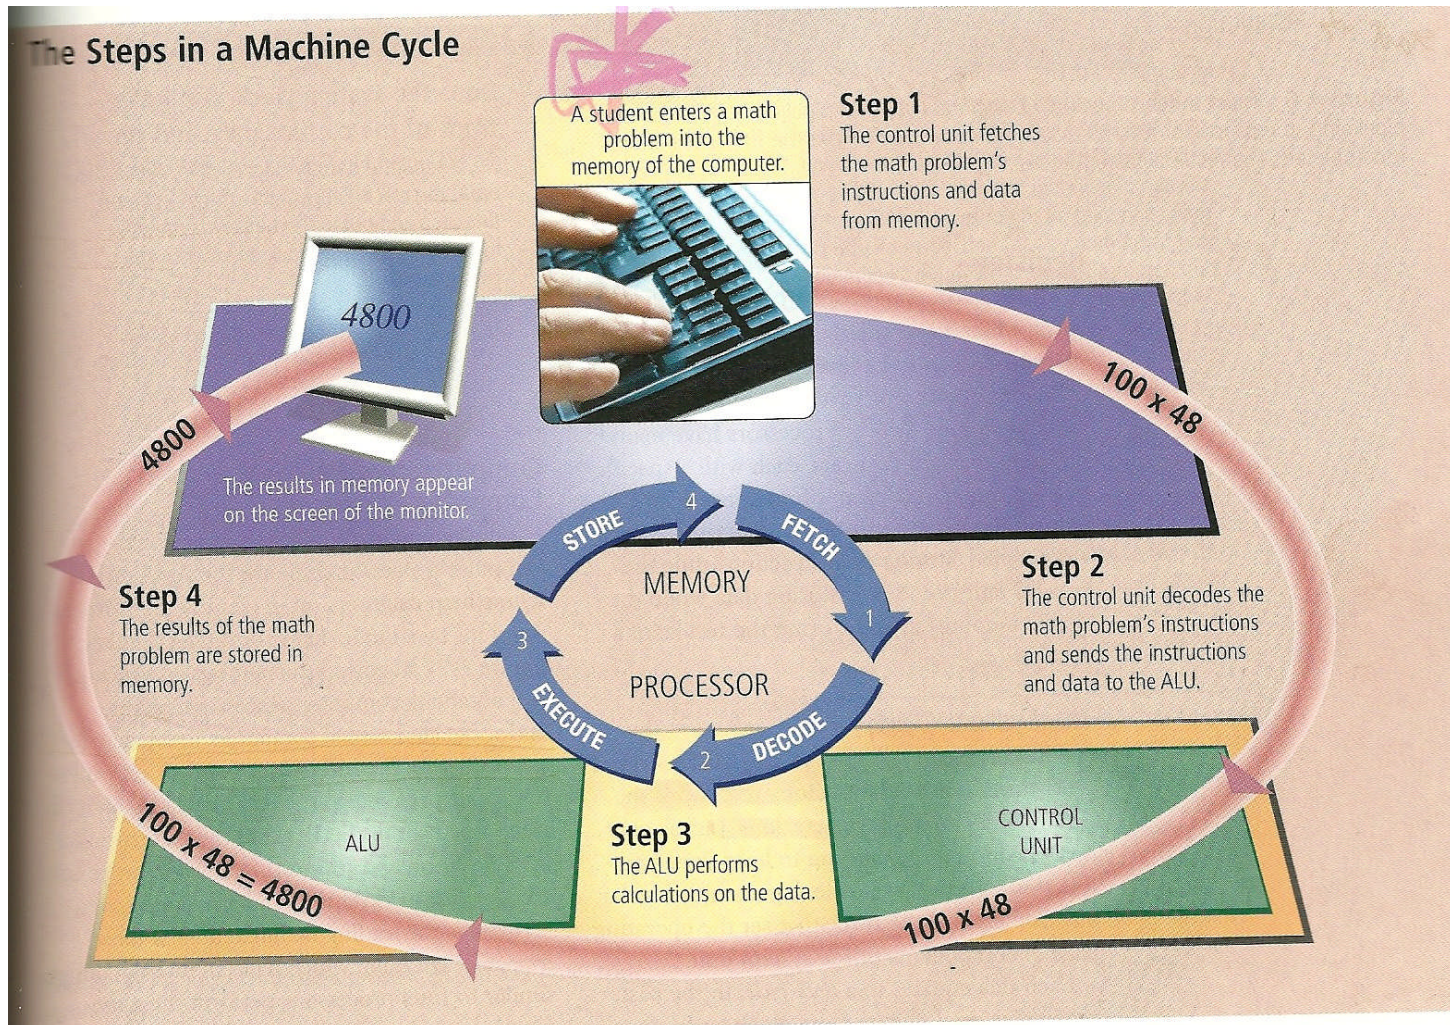

# PROCESSOR

- Quad core processor is a chip with four separate processor cores.
- A control unit is the component of the processor that helps to direct and coordinate most of the functions in the computer.
- Arithmetic logic unit (ALU) is also a component of the processor, it performs arithmetic, comparison, and other operations.

# PROCESSOR

# PROCESSOR

- A processor contains small, high speed storage locations, called registers that temporarily hold instructions and data.
- The processor relies on a system clock that controls the timing of all the computer operations.
- The clock speed is measured by the number of ticks per second.

# DATA REPRESENTATION

- The binary system is a number system that has just two unique digits, 0 and 1.

A bit also known as binary digit, is the smallest unit of data the computer can process.

A byte is when eight bits are grouped together as a unit.

# PROCESSOR

- One gigahertz (GHz) = one billion ticks of the system clock per second.
- Computers today might use a high speed processor, in the Intel Core family.

# MEMORY

- Memory consists of electronic components that store instructions waiting to be executed by the processor, data needed by those instructions, and the results of processing the information.
- There are 2 types of memory, Volatile is temporary and nonvolatile is permanent memory.

# MEMORY SIZES

- Kilobyte (KB OR K) is equal to exactly 1,024 bytes.
- Megabyte (MB) is equal to about one million bytes.
- Gigabyte (GB) is equal to about one million bytes.
- Terabyte (TB) is equal to approximately one trillion bytes.

# MEMORY TERMINOLOGY

- Read only memory (ROM)
- Flash Memory
- Complementary metal-oxide semiconductor (CMOS)
- Access time
- Nanosecond

# EXPANSION SLOTS AND ADAPTER CARDS

- Expansion slots
- Adapter card
- Sound card
- Video card
- Plug and Play

# PORTS AND CONNECTORS

A port is the point at which a peripheral attaches/ communicates with a system unit so that the peripheral can send data to the computer.

A jack is used to identify audio and video ports.

A connector joints a cable to a port.

Universal serial bus port (USB)

# PORTS AND CONNECTORS

- FireWire port can connect multiple types of devices that require faster data speeds.
- FireWire hub plugs in a FireWire port on the system unit and contains multiple FireWire ports in which you plug cables from the FireWire devices.
- SCSI port

# PORTS AND CONNECTORS

- eSATA
- Bluetooth
- IrDA
- Serial
- MIDI

# PORT TYPES

Port Types					
Type	Picture	Type	Picture	Type	Picture
Audio in		HDMI port		Serial	
Cable TV		Headphones		Side surround sound	
Center surround sound/subwoofer		Keyboard		S/PDIF in	
Composite video in		Microphone		S/PDIF out	
Digital Video Interface (DVI)		Monitor		Speaker	
eSATA port		Mouse		S-video	
FireWire		Network		Telephone line in	
FM reception		Rear surround sound		USB	

# BUSES

Buses are used to transfer bits from input devices to memory, from memory to the processor, from the processor to memory, and from memory to output/storage devices.

Word size is the number of bits the processor can interpret and execute at a given time.

# BAYS

- A bay is an opening inside the system unit in which you can install additional equipment.
- 
- Drive bay is a regular opening that typically holds disk drives.
- External bay allows user to access opening in the bay from outside the system unit.
- Internal bay is concealed entirely within the system unit.

# POWER SUPPLY

- A power supply is the component of the system unit that converts the wall outlet AC power into the DC power.
- AC adapter is an external power supply. An example would be a cable modem, speakers, or a printer.

# THE END
