

## Hands-On Eighteen

# Cystic Fibrosis

## Transmembrane Conductance Regulator

### A) The CFTR Gene and Protein

We are going to retrieve the human CFTR gene from NCBI:

- Go to NCBI: <http://www.ncbi.nlm.nih.gov/>
- Click on “Gene” under “Popular Resources” (right-hand side of page)
- Get the CFTR human gene by typing in “cystic fibrosis” in the search window and clicking on the blue “Search”
- From the result page, choose the human CFTR (with Gene ID: 1080) by clicking on “CFTR”

1) When was the record last updated? \_\_\_\_\_.

Upon reading “Summary”, we learn that the protein encoded by this gene (the CFTR protein) is a member of the ATP-binding cassette (ABC) transporter superfamily.

2) What do ABC proteins transport?  
\_\_\_\_\_.

3) What does the CFTR protein function as?  
\_\_\_\_\_.

4) What diseases are associated with mutations of the CFTR gene?  
\_\_\_\_\_.

We are going to retrieve the CFTR protein from NCBI:

- Go to NCBI: <http://www.ncbi.nlm.nih.gov/>
- Click on “Protein” under “Popular Resources” (right-hand side of page)
- Get the CFTR protein by typing in its accession number “NP\_000483”
- Click on the blue “Search”

5) When was the record last updated? \_\_\_\_\_.

6) What is the size of the CFTR protein? \_\_\_\_\_.

Many proteins have conserved domains. Let us view the conserved domains of the human CFTR protein.

- Click on “Identify Conserved Domains” under “Analyze this sequence” on the right hand-side of the NP\_000483 record.

7) Why do you think the CFTR protein has a region in the middle that is not similar to other ABC transporters? What do you suppose is the function of this unique region?

- Hover (place the mouse without clicking) over the “ABC\_membrane” domain to learn more about it. Note there are two of these domains in the protein.

8) Are they membrane-spanning proteins? \_\_\_\_\_. Explain.

\_\_\_\_\_.

9) Record in the following table, the starting and ending locations of the two ABC\_membrane domains.

<b>ABC Membrane</b>	<b>Strating Position</b>	<b>Ending Position</b>
First		
Second		

- Hover over the “ABCC\_CFTR1” and “ABCC\_CFTR2” domains to learn more about them.

10) Are they membrane-spanning proteins? \_\_\_\_\_. Explain.

\_\_\_\_\_.

11) Record in the following table, the starting and ending locations of the two conserved domains.

<b>ABCC CFTR</b>	<b>Strating Position</b>	<b>Ending Position</b>
ABCC_CFTR1		
ABCC_CFTR2		

- Go back to the page that contains the NP\_000483 record.

To find sequences that are similar to the human CFTR protein, one could blast NP\_000483 against the protein sequences of GenBank. Alternatively, we could look at precomputed blast results.

- Scroll down to “Related information” on the right-hand side of the page, and hover over “BLink”.

12) What does BLink represent?

\_\_\_\_\_.

- Click on “BLink” to go to the “Pre-computed BLAST results” page.

13) How many proteins are reported to be similar (with a score of at least a 100) to the human CFTR protein (NP\_000483)? \_\_\_\_\_.

14) Are all the reported hits from the same species? \_\_\_\_\_. Explain.

\_\_\_\_\_.

## B) Transmembrane Protein Structure Predictors

We are going to compare several transmembrane protein predictors by running them with one of the conserved domains of the human CFTR protein.

- Obtain the human CFTR protein sequence in Fasta format: “Human\_CFTR\_protein\_wildtype.txt”. Alternatively, we can get it from GenBank at NCBI. Its accession number is NP\_000483 (and P13569).

Since this protein is big, we are going to extract from “Human\_CFTR\_protein\_wildtype.txt” a region that includes the first ABC\_Membrane conserved domain (recall Question 9 on page 2).

- Go to the Sequence Manipulation Suite at: <http://www.bioinformatics.org/sms2/>
- Click on “Range Extractor Protein” under “Format Conversion” on the left-hand side of the page.
- Paste the “human\_CFTR\_protein\_wildtype.txt” sequence in the window (replacing the “sample sequence”)
- Enter “50..400” in the extractor window and click on “Submit”.
- Save the resulting sequence under “human\_CFTR\_protein\_extract.txt”.

### I) TMHMM

Open a web browser and go to the TMHMM server at: [www.cbs.dtu.dk/services/TMHMM/](http://www.cbs.dtu.dk/services/TMHMM/)

- Paste the sequence (human\_CFTR\_protein\_extract.txt) in the appropriate window, keep the default options, and press “Submit”.
- From the new page, click on the “[HELP](#)” link at the top of the page to go to “TMHMM2.0 User's guide”.
- Go over the guide, and then go back to the output page. Understand the results and complete the following table:

Starting Position	Ending Position	Location of Segment

15) Are you surprised by the result or did you expect it? Explain.

II) Open a web browser and go to the MINNOU server at:

<http://minnou.cchmc.org/>

- Paste the “human\_CFTR\_protein\_extract.txt” in the appropriate window and edit it to remove the FASTA information line. In other words, remove the line that starts with the “>” symbol.
- Click on “Submit” and you will get the results in a new page. It might take a while though. Alternatively, you can leave your email address so as to be notified when the job is done.

16) Understand the results and complete the following table:

Starting Position	Ending Position	Location of Segment

III) We are going to use three more transmembrane protein predictors. All 3 packages can be accessed from <http://expasy.org/tools/>.

For the next 3 questions:

- Go to <http://expasy.org/tools/> and scroll down to “Topology prediction”.

a) Choose TMpred [TMpred - Prediction of transmembrane regions and protein orientation (EMBnet-CH)]

- In the new page, paste the “human\_CFTR\_protein\_extract.txt” sequence in the appropriate window.
- Click on “Run TMpred”.

17) Understand the results and complete the following table:
