SJSU Course Evaluation

 $\bullet \bullet \bullet$

Team 131

What is our objective

Objective is to provide useful information about courses in SJSU for students who will be enrolled in them for the next semester.

-Veteran students will provide the information in order to reduce the amount of time, money, and stress that a course provides, by guiding them in the right path.

Programming in med. size team of 5

-Time Frame 1 semester

-Documentation/Project Artifacts: requirement specifications, design review, project schedules, code review

-Used Ruby on rails and some bootstrap.

-MVC:Model View Controller

-M contains: Maintains the data of the application

-V contains: Displays the model to the user

-C contains: Manages the application flow and user interface

- App started with rails fast start implementation of MVC

Model

- Since using models we are using dynamic web pages
- Some of our models include evaluations, which belongs to courses
- Which belong to users

Contains presentation layer

- Our View contains html and embedded ruby code and some start bootstrap html code in order to make the interface plesent to the user

Controller

-Controller is used to route to different view pages based on the user input

-Rails uses REST which we took advantage of routes

Database

- Ruby on rails was used to establish our database and update/edit our database

-rails made it easy enough so that we didn't have to learn SQL

- App also contains some data validations in order to notify the user

Agile development

-We added requirements and steadily improved each one whether it would be adding more functionality for the requirements or making it more pleasant looking.

- Ex. our course has gone through many iterations :

- 1. Set up basic functionality: create, edit, destroy, and show
- 2. Make sure only users with accounts can create Courses
- 3. Only one Course with the same name can be created
- 4. Add a search function within the Courses

Functional Specification

Some functional requirements that will be demonstrated:

- 1. Courses will not have multiple creations, created by students(admin in the future)
- 2. The application must allow students to read the evaluations of a course after signing in
- 3. The application will not allow students to delete other people's evaluations
- 4. Search results will allow students to create new course if course doesn't exists

Non Functional Requirements:

- 1. Login requirements
- 2. error or success messages shall be displayed

Brief Use Case Description: New Evaluation

- 1. Goal: Create a new evaluation
- 2. Summary: Veteran students informes future students of what to expect of a course
- 3. Actors: Veteran Students
- 4. Preconditions: Logged in
- 5. Trigger: Click "Create Evaluation"
- 6. Sequence: Input required information : helpfulness, difficulty, time spent on classwork/study, grade received, references (books, urls, articles, videos), professor, and additional comments.
- 7. Post: Evaluation created

Usability

- Find information easily
- -Can tell what is clickable and what is not.
- -Easy to find key components
- Visual hierarchies can use some work

Test Case

Add Evaluation

-Purpose:Test that the "Create Evaluation" command will generate a new evaluation for a course

-Preconditions: website is running, must be logged in, button "create evaluation" has been clicked, web page for adding evaluation is showing

Manual operation: fill in the required fields with the required information

Expected Results: Information will be displayed under the desired course

Accepted Criteria: Information related to the course, if missing information display error
