

JDBC Java database connectivity

Copies ODBC but for Java (some variations)
(Microsoft)

This is even a bridge so can use
ODBC data sources in Java

Connecting. -

Need to get driver...

```
DriverManager.registerDriver(  
    new oracle.jdbc.OracleDriver());
```

```
Connection conn =  
    DriverManager.getConnection(connectString, login,  
                                password);
```

Statement stmt = conn.createStatement()

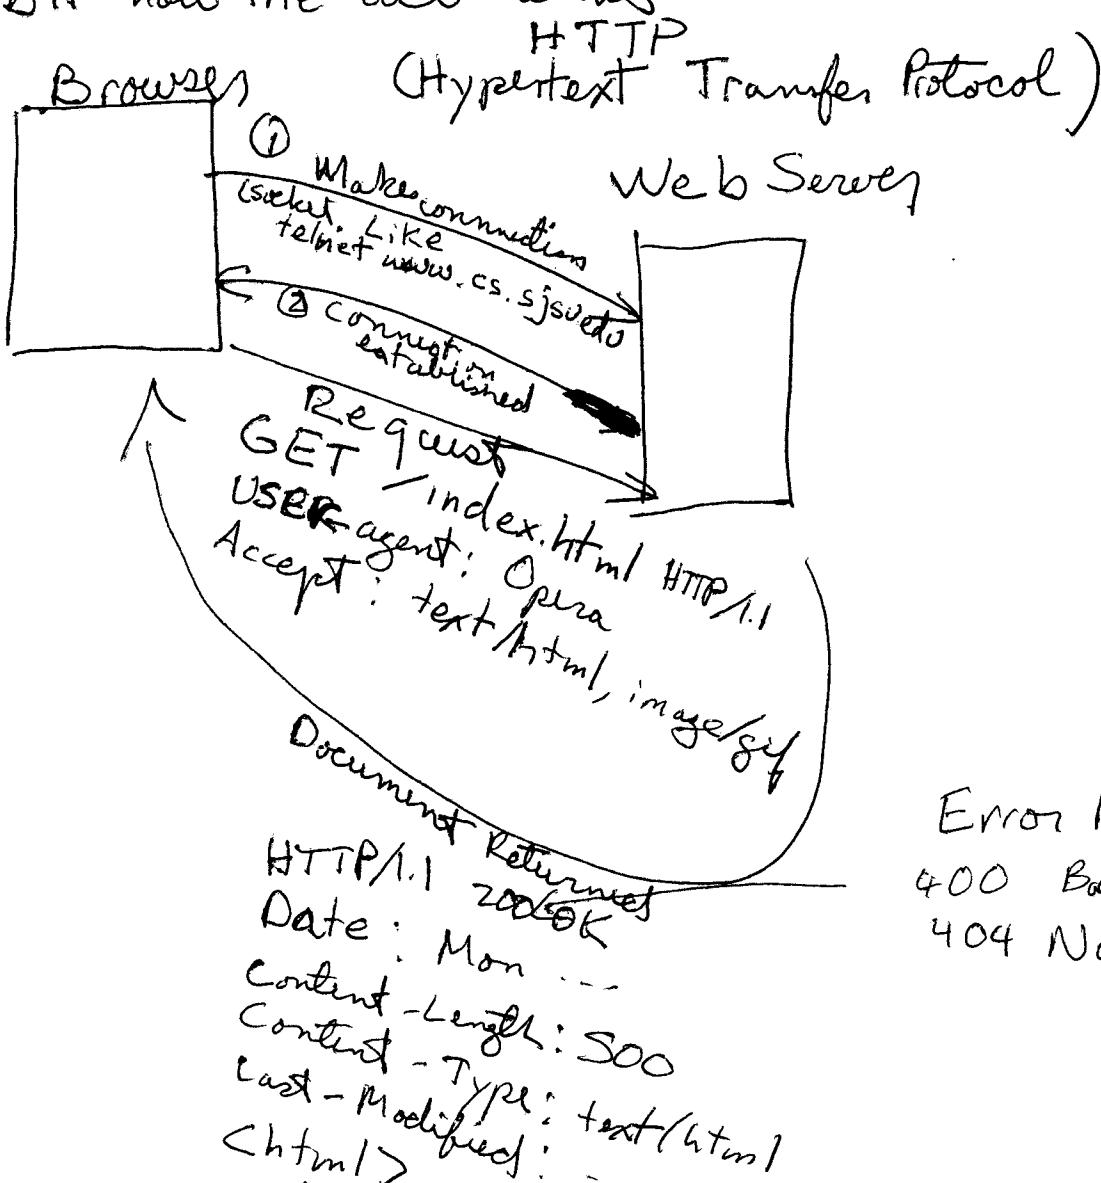

```
use  
PreparedStatement  
to pass  
variables  
ResultSet rset = stmt.executeQuery  
    ("Select * from EMP");  
rset.next();  
String firstCol = rset.getString(1);  
rset.close();  
conn.close();
```

Internet Applications of DBs

Much of today's business is done over the internet.

So it is important to be able to connect databases to the web.

To do this it is helpful to know a little bit how the web works

SSL - secure socket layer - secure version
Stateless - doesn't remember previous requests

Solution: Identifier for
can code previous requests as a string
after url

`http://mynetwork.org/?id=blah`

Or

can use cookies.

HTML - hypertext markup language

Basic building blocks are tags

$\langle \text{tag} \rangle$ $\langle \text{tag} \rangle$
↑ ↑
open close

open *close*
 Really Bold

HTML originally case insensitive but modern versions lower case

renders in browser in bold face

Basic Document

<!DOCTYPE > → not required
<html> but prevents browser
- [<head> from using quirks mode
 <title> My doc </title>
 <head> ^{option info to send w/ request} ~~.../~~ meta ...
 <body>
 <h1> My Doc </h1> such as content + types
 <p> Some text </p> & charset
 </body>
</html>
